

It will do no good to switch to wind or solar unless energy conservation is at the forefront of every plan. The money being spent to cut down trees to make room for solar panels and wind turbines (!) should be put to massive homeowner help for better insulation and buyback programs for outdated appliances. Furthermore, as the recent Texas freeze has made clear, decentralization of energy sources sounds good but exposes communities to disaster when the local systems fail.

Thank you for the opportunity to put these comments on record,
